

X-BVM

X-System On-board Ticket Machine

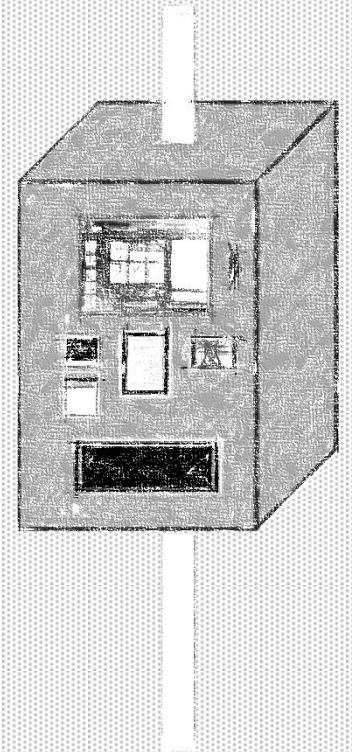

Work in progress

X-BVM

X-BVM is an acronym for “on-board” Vending Machine created by X-System.it.

It is a “self service” ticket issuing system which is usually set up on public transports, with a 12/24V power supply system.

It issues paper tickets on the ISO 7813 format with a readable print or QR code print. Coin payment and banknote denominations payment are available. It is a banknotes and coins change-giver and accepts bank payment cards: microchip cards, contact cards, RFID, “chip on paper” and it handles pass registrations.

The so called “friendly” software supervises the ticket issue procedures. It communicates with users through an icon guide on a 6” capacitive touch screen. The system is connected to the company’s server through a Lan connection or a mobile network.

X-BVM is controlled by a sophisticated software monitoring the system efficiency. It sends alert messages in case of anomaly operations and it allows the remote update both of the charts and the application software.

The system storages are able to find out the sales trend through the remote connection. They are constantly updated.

Technical documents concerning the system, the manuals and the maintenance installation are available on our company website.

Moreover, there are all the certifications required by the law.
